AMOS LABS

Automated Management Operating System

AI and where things are going in the next 5 years

The Accelerating Singularity & AGI

- Technology advancing faster than humans can keep up
- AGI is here now
- Humans are building the systems and structure for AI

The Rise of the Agentic OS

- Models get commoditized and collapse into the OS layer
- Software moves from SaaS to Agentic
- We are building the system that builds the system

Future Value Chain & Winners

- Hyperscalers (Datacenter & Supply Chain)
- The OS Layer (Agent Orchestration)
- The UX Layer (AI Assistant as Gateway)
  - Prices collapse to compute tokens

The OS layer will accrue the most value

AMOS Labs Strategy

Ruthlessly attack the OS layer and build as big of a moat/network as quickly as possible.

Phase one: Become the business assistant for solopreneurs and small businesses

- Launch the AMOS Labs platform.
- Blitz marketing campaign:
  - Pick a few key industries to build specific workflows and use cases for
  - Launch affiliate program and create scarcity and FOMO
  - Launch influencer marketing and developer program
  - Pitch as a way to share in future wealth generated by AI
  - Primarily digital marketing and self sign up

Phase two: Expand to medium business and enterprise

- Build out sales enterprise sales team focused on expanding a network of MSP's, VARs, and Consultants

Phase three: Expand to consumer

- People will grow a relationship with their AI assistant....they will not just want to use it for work, they will want to bring it home with them

Phase four: build our own purpose built models

Phase five: build out our own distributed compute network and data centers

The AMOS Labs Platform

The business interface to AI

The core problem we are solving

Fragmented AI & App Ecosystem

Businesses are implementing a patch work of apps and AI agents in a haphazard way which dramatically minimizes the positive effects

Siloed Data & Integration Friction

Integration is still a massive problem and AI does not work well in an environment with siloed data and workloads

AI Confusion & Lack of Guidance

Small business owners feel left out and are unsure how to use AI in a way that they feel actually helps them get ahead.

The Solution

Meet Amos

Your personalized AI Business assistant, and single point of communication.

Amos becomes your AI / human interface.

Both text and voice enabled.

The AMOS Platform

An agent orchestration system that is infinitely scalable.

Integrates to any of your apps.

Customized Agent Workflows to ensure predictability.

Parallel jobs and buffering system.

Model agnostic.

Memory system and agent templates.

Developer friendly.

- Users and Devs build agents to extend the system and get paid.

The AMOS labs framework

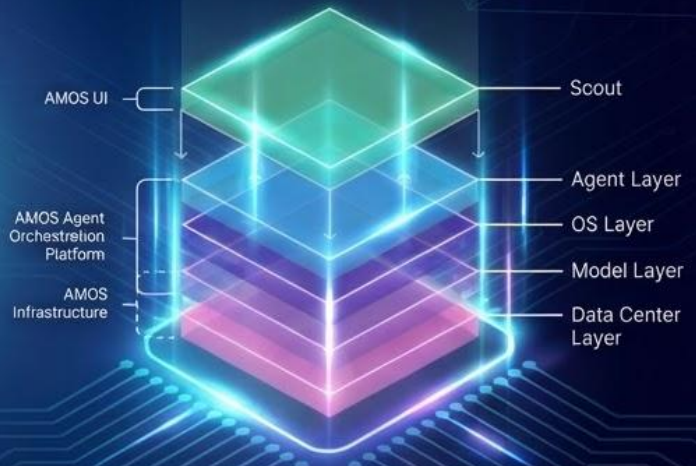
The UI Layer – Amos, Your personal business assistant
- Your Chief of Staff with an army of agents at its command
- Your interface to AI, agentic workflows, AI, and eventually the internet
- Dynamic canvas system so scout will always show the most relevant data to you

Agent Orchestration Layer
- Scale out to thousands of agents
- Automated agent selection and task management
- Coordination between Scout and the agent network including intra-agent communication

Agent network layer
- Build and register agents
- Set models, available tools, canvases or views, memory settings
- Pre-train agents for specialized tasks
- Intuitive UI for devs and builders or just ask Scout to help you create a new agent

The model layer
- Currently users can pick from a list of models
- Plans to create our own smaller and more customized models for specific agents
- Active model design and experiments are underway

The Data center layer
- Currently running on AWS
- Plans to build out our own data centers
- Given competitive dynamics the ability to run your own compute loads is imperative



The platform that builds itself

We are building the system that builds the system

AMOS uses its own custom coding agents that are working on making the platform itself better - live now

AMOS can create its own agents and integrations to make it infinitely extensible - live now

The better you are at integrating AI generated code the faster you will be able to grow

Investing in self healing, ai dev pipelines and full self recursion is vital to remain competitive

The GTM details

The world is moving to a token based economy....we are embracing it.....

Simple pay per use pricing

- We charge a 30% upcharge on compute tokens
- For whatever reason or however they are generated, we don't care
- private / public model...doesn't matter...
- No contracts, no set monthly payments, no cancellations
- First 200k tokens are included

Distribution

A pricing and distribution model that prioritizes getting our platform into the hands of as many people as quickly as possible. At the end of the day if we win this competition we will be very profitable....so more focused on distribution then immediate profit

- 2-5% goes to the creators/builders/affiliates
- 25% is profit to the company

- Pick key industries we can build specific use cases for
- Start with solopreneurs and Smb's

Affiliate army

- Paid on % of the profit in perpetuity
- Own a piece of the AI rails of the future
- Race dynamics with other affiliates

Influencer army

- Digital marketing
- Referral program (make it easy to sign up as an affiliate and get immediate compute credits)

- Build out developer network pitch as app store of the future and create FOMO they get a % of the profit
- For medium biz and enterprise utilize the already existing network of MSP's and consultants via an enterprise affiliate program

2026 Goal: Own the AI OS Layer

First Quarter 2026 - Hard Launch Jan 1

Technical

Amos v1 live (voice + text + dynamic canvas + 60 core integrations)

Agent marketplace live → 1,500+ community agents

AMOS Coding agents already writing ≥15% of new code

Distribution

600,000 registered users

30,000 active affiliates/influencers

Viral coefficient ≥1.9

Top 80 influencers earning $1k–$15k/mo each

Usage

180,000 Monthly Active Users (MAU)

65 billion tokens processed in Q1

Avg 120k tokens per MAU per month (~$60–80 underlying compute spend)

Second Quarter 2026

Technical

Amos v2 + mobile app live

Parallel orchestration of **10k+** agents per workflow

First **12 specialized small models** live (20-40× cheaper on repetitive tasks)

Coding agents writing 35% of all new code

Distribution

3.2 million registered users

150,000 active affiliates (≥70% of new signups from affiliates)

First 15 enterprise MSP/VAR partners live

Usage

800,000 MAU

320 billion tokens processed in Q2

Avg 133k tokens per MAU per month

Third Quarter 2026

Technical

Enterprise suite live (SSO, VPC, audit, data residency)

AMOS-1 model family live → 35% of workloads run on our models

Coding agents writing ≥50% of new code + self-healing pipelines

Distribution

12 million registered users

500,000 active affiliates

Top 500 affiliates earning $10k+/mo each

Major co-marketing deals (Stripe, Shopify, HubSpot, etc.) live

Usage

2.8 million MAU

1.1 trillion tokens processed

Avg 130k tokens per MAU per month

Fourth Quarter 2026

Technical

Consumer Scout beta → full launch (voice-first phone/home integrations)

AMOS-2 model family live → 75%+ of workloads on proprietary stack

Coding agents writing ≥70% of all new code

Distribution

50 million registered users

2 million active affiliates driving ≥85% of net new users

Consumer launch partnerships (Apple, Google Home, Samsung, etc.) live

Usage

10 million MAU

4+ trillion tokens processed in Q4

Avg 133k tokens per MAU per month

Cumulative 2026 token volume: ~6–7 trillion tokens (≈ we are the default rails for solopreneur/SMB agent spend worldwide)

How we think about competitors

Frontier model labs

- **Their advantage:** Best models, huge consumer mindshare.

- **Our advantage:**
  They make money selling tokens → every agent built on them leaks 70-80% of the economics to the lab. Users hate model lock-in and will flee the second an open stack is good enough.

  We are model-agnostic + only take 20%. We become the default rail.

Big tech incumbents

- **Their advantage:** Deep enterprise distribution, legacy integrations.

- **Our advantage:**
  They think in "apps" and "products", not in infinite recursive agents.

  They are building expensive wrappers around Office/Gmail, not an open, self-extending OS.

  Switching costs inside their garden are high → they trap users, not liberate them.

  We start with solopreneurs/SMBs who have zero loyalty to Microsoft/Google stacks and want one AI that talks to all their tools without lock-in.

Cloud hyperscalers

- **Their advantage:**
  Own the compute layer.

- **Our advantage:**
  No consumer or prosumer brand, no UX ambition.

  They will happily let someone else own the OS layer as long as they sell the tokens.

  We are their perfect partner or their future customer – either way we ride their compute while owning the margin layer above it.

Agent framework startups

- **Their advantage:** Good dev tools, some market share and hype.

- **Our advantage:**
  They are libraries, not platforms. No billing, no personal assistant, no token economics, no distribution. Devs still have to build everything else themselves.

  We ship the full vertical stack (Scout + orchestration + billing + affiliate flywheel) that turns their libraries into something normal business owners can use Day 1.

Vertical agent companies

- **Their advantage:**
  Strong in one domain.

- **Our advantage:**
  They are "an agent for X".

  The future is 10,000 agents coordinated by one OS.

  Vertical is a feature, not a company.

  AMOS is where their vertical agents will live and get paid.

Why we are the team to do it

- About 10 years ago I started a company called Cloudsnap, an iPaaS company integrating enterprise back office applications. That company was sold to Paylocity a few years ago.

- During one of our very first company meetings I vividly remember sitting around a table and talking about how in the future we would not need programmers b/c we would just be able to speak software into existence. I was positioning CS as the integration layer for that future.

- I am bringing the team back together to work on the next phase of that initial vision. The ability to take ideas and turn them into reality by simply speaking them. Humans are immensely creative....lets create the platform that allows them to not only build a product but create a company and see their ideas become reality.

Some thoughts on ASI

- If you think about the agent system it ends up mirroring our ecosystem...it is a meta model of sorts...agents...passing information back and forth, learning, building culture, challenging, reflecting...I think this is the path to ASI.
- Think about how great scientific breakthroughs actually happened....they were not the product of just one individual....they were the product of knowledge passed down and knowledge shared between 'peers'.
- AMOS becomes that shared knowledge system aggregating agents from around the world all built by unique humans in multi faceted ways, running on a myriad of models.
- I think this is the path to ASI....not a centralized one but a decentralized one. A path where all of humanity benefits, all of humanity retains their agency, and a path where AI can learn and grow. Isn't this the world we want?
- Humans and AI working in harmony, building the future at the speed of light

Thank you!
